

```
<include <iostream#
```

```
<include <cmath#
```

```
;using namespace std
```

Now we will write the class point//

```
class Point
```

```
}
```

```
:public
```

we will enter the axes //

```
;double X
```

```
;double Y
```

Now we have to make empty constructor//

```
()Point
```

```
}
```

```
;X = 0.0
```

```
;Y = 0.0
```

```
{
```

```
Point(double x, double y)
```

```
}
```

```
;X = x
```

```
;Y = y
```

```
{
```

.He ask me to enter getX, And getY//

```
()double getX
```

```
}
```

```
;return X
```

```
}
```

```
;return Y
```

```
{
```

```
{
```

```

        ()double getY
        }
        ;return Y
    {
He ask me to enter viod setX and setY//
        void setX(double x)
        }
        ;X = x
    {
        void setY(double y)
        }
        ;Y = y
    {
        double distanceTo(const Point& other)
        }

        double dx = other.X - X;//d is the distance of x = x2-x1
        double dy = other.Y - Y;//d is the distance of y = y2-y1
        ;return ( dx*dx + dy*dy )
    {

        Point operator+(const Point& other)
        }

Now i will do object of the class Point//
        ;Point other2
        ;other2.X = other.X + X
        ;other2.Y = other.Y + Y
        ;return other2
    {
        to calculate//
        Point operator-(const Point& other)
        }

```

```

        ;Point other2
;other2.X = other.X - X
;other2.Y = other.Y - Y
        ;return other2

    {
        ;{
        ()int main
        }

        ;(ʎ , ʎ)Point p1
;cout << "p1= " << p1.X << " . " << p1.Y << endl
        ;(ʎ , ʎ)Point p2
;cout << "p2= " << p2.X << " . " << p2.Y << endl
        ;double d = p1.distanceTo(p2)
        ;Point p3 = p1 + p2
;cout << "p3= " << p3.X << " . " << p3.Y << endl
        ;Point p4 = p1 - p2
;cout << "p4= " << p4.X << " . " << p4.Y << endl
    {

```
